

# Repetition and Loop Statements

## Chapter 5

*Problem Solving & Program Design in C*

*Eighth Edition*

*Jeri R. Hanly & Elliot B. Koffman*

# while Statement Syntax

```
while (loop repetition condition)  
    statement;
```

```
/* display N asterisks. */  
count_star = 0  
while (count_star < N) {  
    printf("*");  
    count_star = count_star + 1;  
}
```

# Increment and Decrement Operators

- `counter = counter + 1`  
`count += 1`  
`counter++`
- `counter = counter - 1`  
`count -= 1`  
`counter--`

# Compound assignment

Operator	Definition
+	addition
-	subtraction
*	multiplication
/	division
%	remainder

Can do these too:

`+=`

`-=`

`*=`

`/=`

`%=`

# Increment and Decrement Operators

- side effect
  - a change in the value of a variable as a result of carrying out an operation

# The **for** Statement Syntax

```
for (initialization expression;  
    loop repetition condition;  
    update expression)  
statement;
```

```
/* Display N asterisks. */  
for (count_star = 0;  
    count_star < N;  
    count_star += 1)  
    printf("*");
```

# do-while Statement

- For conditions where we know that a loop must execute at least one time
  1. Get a *data value*
  2. If *data value* isn't in the acceptable range, go back to step 1.

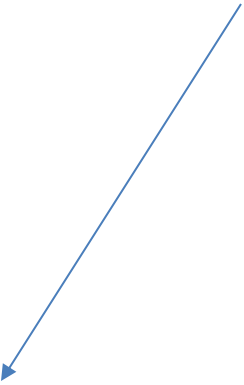

# do-while Syntax

```
do  
    statement;  
while (loop repetition condition);
```

We will talk more  
about the output  
of scanf next  
time

```
/* Find first even number input */  
do  
    status = scanf("%d", &num);  
while (status > 0 && (num % 2) != 0);
```

# Nested Loops

- Loops may be nested just like other control structures
- Nested loops consist of an outer loop with one or more inner loops
- Each time the outer loop is repeated, the inner loops are reentered, their loop control expressions are reevaluated, and all required iterations are performed

# Chapter Objectives

- To understand why repetition is an important control structure in programming
- To learn about loop control variables and the three steps needed to control loop repetition
- To learn how to use the C **for**, **while**, and **do-while** statements for writing loops and when to use each statement type
- To learn how to accumulate a sum or a product within a loop body

# Chapter Objectives

- To learn common loop patterns such as counting loops, sentinel-controlled loops, and flag-controlled loops
- To understand nested loops and how the outer loop control variable and inner loop control variable are changed in a nested loop
- To learn how to debug programs using a debugger
- To learn how to debug programs by adding diagnostic output statements

# Repetition in Programs

- loop
  - a control structure that repeats a group of steps in a program
- loop body
  - the statements that are repeated in the loop

# Comparison of Loop Kinds

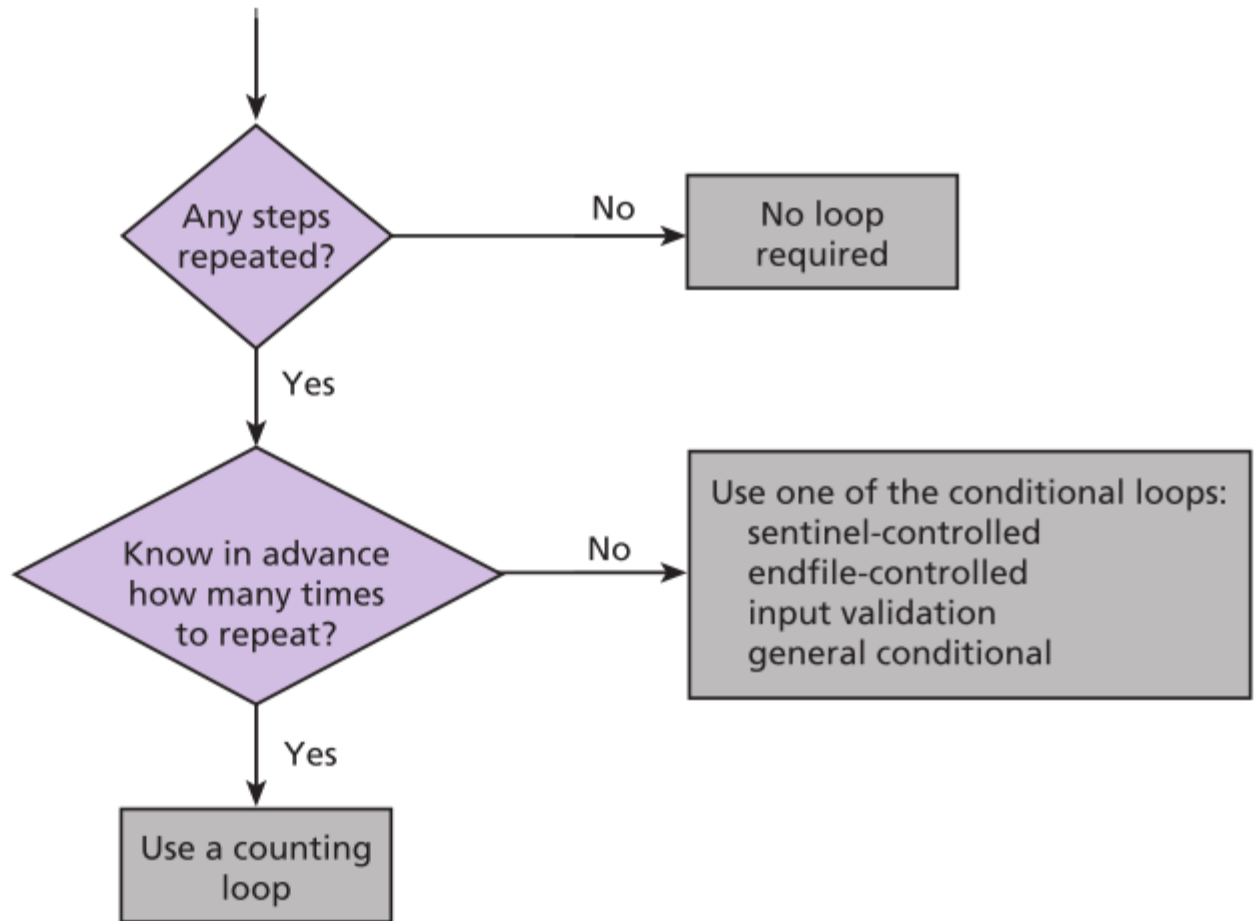

- counting loop
  - we can determine before loop execution exactly how many loop repetitions will be needed to solve the problem
    - while, for
- sentinel-controlled loop
  - input of a list of data of any length ended by a special value
    - while, for

# Comparison of Loop Kinds

- endfile-controlled loop
  - input of a single list of data of any length from a data file
    - while, for
- input validation loop
  - repeated interactive input of a data value until a value within the valid range is entered
    - do-while
- general conditional loop
  - repeated processing of data until a desired condition is met
    - while, for

**FIGURE 5.1**

Flow Diagram  
of Loop Choice  
Process

# Counting Loops

- counter-controlled loop
  - a.k.a. counting loop
  - a loop whose required number of iterations can be determined before loop execution begins
- loop repetition condition
  - the condition that controls loop repetition

# Counting Loops

- loop control variable
  - the variable whose value controls loop repetition
- infinite loop
  - a loop that executes forever

# while Statement Syntax

```
while (loop repetition condition)  
    statement;
```

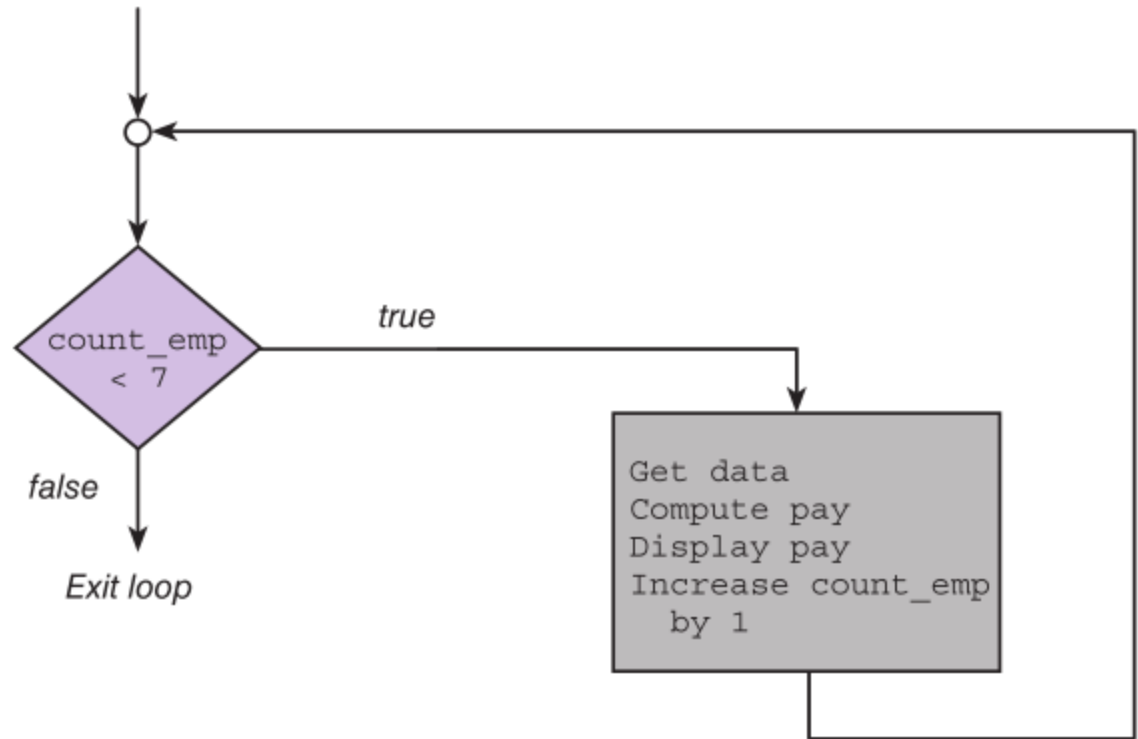

```
/* display N asterisks. */  
count_star = 0  
while (count_star < N) {  
    printf("*");  
    count_star = count_star + 1;  
}
```

**FIGURE 5.2** Program Fragment with a Loop

```
1. count_emp = 0;                /* no employees processed yet    */
2. while (count_emp < 7) {        /* test value of count_emp    */
3.     printf("Hours> ");
4.     scanf("%d", &hours);
5.     printf("Rate> ");
6.     scanf("%lf", &rate);
7.     pay = hours * rate;
8.     printf("Pay is $%6.2f\n", pay);
9.     count_emp = count_emp + 1; /* increment count_emp          */
10. }
11. printf("\nAll employees processed\n");
```

**FIGURE 5.3**

Flowchart for  
a while Loop

# Computing a Sum or Product in a Loop

- accumulator
  - a variable used to store a value being computed in increments during the execution of a loop

**FIGURE 5.4** Program to Compute Company Payroll

---

```
1.  /* Compute the payroll for a company */
2.
3.  #include <stdio.h>
4.
5.  int
6.  main(void)
7.  {
8.      double total_pay;      /* company payroll      */
9.      int     count_emp;     /* current employee */
10.     int     number_emp;    /* number of employees */
11.     double hours;          /* hours worked      */
12.     double rate;           /* hourly rate       */
13.     double pay;            /* pay for this period */
```

*(continued)*

FIGURE 5.4 (continued)

```
14.
15.      /* Get number of employees. */
16.      printf("Enter number of employees> ");
17.      scanf("%d", &number_emp);
18.
19.      /* Compute each employee's pay and add it to the payroll. */
20.      total_pay = 0.0;
21.      count_emp = 0;
22.      while (count_emp < number_emp) {
23.          printf("Hours> ");
24.          scanf("%lf", &hours);
25.          printf("Rate > $");
26.          scanf("%lf", &rate);
27.          pay = hours * rate;
28.          printf("Pay is $%6.2f\n\n", pay);
29.          total_pay = total_pay + pay;          /* Add next pay. */
30.          count_emp = count_emp + 1;
31.      }
32.      printf("All employees processed\n");
33.      printf("Total payroll is $%8.2f\n", total_pay);
34.
35.      return (0);
36. }
```

Enter number of employees> 3

Hours> 50  
Rate > \$5.25  
Pay is \$262.50

Hours> 6  
Rate > \$5.00  
Pay is \$ 30.00

Hours> 15  
Rate > \$7.00  
Pay is \$105.00

All employees processed  
Total payroll is \$ 397.50

**TABLE 5.2** Trace of Three Repetitions of Loop in Fig. 5.4

Statement	hours	rate	pay	total_pay	count_emp	Effect
	?	?	?	0.0	0	
count_emp < number_emp						true
scanf("%lf", &hours);	50.0					get hours
scanf("%lf", &rate);		5.25				get rate
pay = hours * rate;			262.5			find pay
total_pay = total_pay + pay;				262.5		add to total_pay
count_emp = count_emp + 1;					1	increment count_emp
count_emp < number_emp						true
scanf("%lf", &hours);	6.0					get hours
scanf("%lf", &rate);		5.0				get rate
pay = hours * rate;			30.0			find pay
total_pay = total_pay + pay;				292.5		add to total_pay
count_emp = count_emp + 1;					2	increment count_emp
count_emp < number_emp						true
scanf("%lf", &hours);	15.0					get hours
scanf("%lf", &rate);		7.0				get rate
pay = hours * rate;			105.0			find pay
total_pay = total_pay + pay;				397.5		add pay to total_pay
count_emp = count_emp + 1;					3	increment count_emp

# General Conditional Loop

1. Initialize loop control variable.
2. As long as exit condition hasn't been met
3. Continue processing

**TABLE 5.3** Compound Assignment Operators

---

Statement with Simple Assignment Operator	Equivalent Statement with Compound Assignment Operator
<code>count_emp = count_emp + 1;</code>	<code>count_emp += 1;</code>
<code>time = time - 1;</code>	<code>time -= 1;</code>
<code>total_time = total_time +                   times;</code>	<code>total time += time;</code>
<code>product = product * item;</code>	<code>product *= item;</code>
<code>n = n * (x + 1);</code>	<code>n *= x + 1;</code>

---

# Loop Control Components

- initialization of the loop control variable
  - test of the loop repetition condition
  - change (update) of the loop control variable
- 
- the **for** loop supplies a designated place for each of these three components

# The **for** Statement Syntax

```
for (initialization expression;  
    loop repetition condition;  
    update expression)  
statement;
```

```
/* Display N asterisks. */  
for (count_star = 0;  
    count_star < N;  
    count_star += 1)  
    printf("*");
```

**FIGURE 5.5** Using a for Statement in a Counting Loop

---

```
1. /* Process payroll for all employees */
2. total_pay = 0.0;
3. for (count_emp = 0;                                /* initialization          */
4.     count_emp < number_emp;                        /* loop repetition condition      */
5.     count_emp += 1) {                             /* update                          */
6.     printf("Hours> ");
7.     scanf("%lf", &hours);
8.     printf("Rate > $");
9.     scanf("%lf", &rate);
10.    pay = hours * rate;
11.    printf("Pay is $%6.2f\n\n", pay);
12.    total_pay = total_pay + pay;
13. }
14. printf("All employees processed\n");
15. printf("Total payroll is $%8.2f\n", total_pay);
```

---

# Increment and Decrement Operators

- `counter = counter + 1`  
`count += 1`  
`counter++`
- `counter = counter - 1`  
`count -= 1`  
`counter--`

# Increment and Decrement Operators

- side effect
  - a change in the value of a variable as a result of carrying out an operation

Increments...

`j = ++i;`

prefix:  
Increment `i` and  
then use it.

`j = i++;`

postfix:  
Use `i` and then  
increment it.

After...

# Computing Factorial

- loop body executes for decreasing value of **i** from **n** through 2
- each value of **i** is incorporated in the accumulating product
- loop exit occurs when **i** is 1

**FIGURE 5.7** Function to Compute Factorial

---

```
1.  /*
2.   * Computes n!
3.   * Pre: n is greater than or equal to zero
4.   */
5.  int
6.  factorial(int n)
7.  {
8.      int i,          /* local variables */
9.          product;    /* accumulator for product computation */
10.
11.     product = 1;
12.     /* Computes the product n x (n-1) x (n-2) x ... x 2 x 1 */
13.     for (i = n; i > 1; --i) {
14.         product = product * i;
15.     }
16.
17.     /* Returns function result */
18.     return (product);
19. }
```

---

# Conditional Loops

- used when there are programming conditions when you will not be able to determine the exact number of loop repetitions before loop execution begins

**FIGURE 5.9** Program to Monitor Gasoline Storage Tank

```
1.  /*
2.   * Monitor gasoline supply in storage tank. Issue warning when supply
3.   * falls below MIN_PCT % of tank capacity.
4.   */

Enter number of gallons removed> 5859.0
After removal of 5859.00 gallons (139.50 barrels),
8361.00 barrels are available.

Enter number of gallons removed> 7568.4
After removal of 7568.40 gallons (180.20 barrels),
8180.80 barrels are available.

Enter number of gallons removed> 8400.0
After removal of 8400.00 gallons (200.00 barrels),
only 7980.80 barrels are left.

*** WARNING ***
Available supply is less than 10 percent of tank's
80000.00-barrel capacity.
```

---

# Loop Design

- Sentinel-Controlled Loops
  - sentinel value: an end marker that follows the last item in a list of data
- Endfile-Controlled Loops
- Infinite Loops on Faulty Data

**TABLE 5.5** Problem-Solving Questions for Loop Design

Question	Answer	Implications for the Algorithm
What are the inputs?	Initial supply of gasoline (barrels). Amounts removed (gallons).	Input variables needed: <code>start_supply</code> <code>remov_gals</code> Value of <code>start_supply</code> must be input once, but amounts removed are entered many times.
What are the outputs?	Amounts removed in gallons and barrels, and the current supply of gasoline.	Values of <code>current</code> and <code>remov_gals</code> are echoed in the output. Output variable needed: <code>remov_brls</code>
Is there any repetition?	Yes. One repeatedly 1. gets amount removed 2. converts the amount to barrels 3. subtracts the amount removed from the current supply 4. checks to see whether the supply has fallen below the minimum.	Program variable needed: <code>min_supply</code>
Do I know in advance how many times steps will be repeated?	No.	Loop will not be controlled by a counter.
How do I know how long to keep repeating the steps?	As long as the current supply is not below the minimum.	The loop repetition condition is <code>current &gt;= min_supply</code>

# Sentinel Loop Design

- Correct Sentinel Loop
  1. Initialize **sum** to **zero**.
  2. Get first **score**.
  3. while **score** is not the sentinel
    4. Add **score** to **sum**.
    5. Get next **score**

# Sentinel Loop Design

- Incorrect Sentinel Loop
  1. Initialize `sum` to `zero`.
  2. while `score` is not the sentinel
  3. Get `score`
  4. Add `score` to `sum`.

**FIGURE 5.10** Sentinel-Controlled while Loop

```
1.  /* Compute the sum of a list of exam scores. */
2.
3.  #include <stdio.h>
4.
5.  #define SENTINEL -99
6.
7.  int
8.  main(void)
9.  {
10.     int sum = 0,    /* output - sum of scores input so far      */
11.         score;      /* input - current score          */
12.
13.     /* Accumulate sum of all scores.                             */
14.     printf("Enter first score (or %d to quit)> ", SENTINEL);
15.     scanf("%d", &score);    /* Get first score.          */
16.     while (score != SENTINEL) {
17.         sum += score;
18.         printf("Enter next score (%d to quit)> ", SENTINEL);
19.         scanf("%d", &score); /* Get next score.          */
20.     }
21.     printf("\nSum of exam scores is %d\n", sum);
22.
23.     return (0);
24. }
```

# Endfile-Controlled Loop Design

1. Get the first *data value* and save *input status*
2. while *input status* does not indicate that end of file has been reached
3. Process *data value*
4. Get next *data value* and save *input status*

**FIGURE 5.11** Batch Version of Sum of Exam Scores Program

```
1.  /*
2.   *   Compute the sum of the list of exam scores stored in the
3.   *   file scores.txt
4.   */
5.  #include <stdio.h>
6.
7.  int
8.  main(void)
9.  {
10.     int sum = 0,      /* sum of scores input so far */
11.        score,        /* current score */
12.        input_status; /* status value returned by scanf */
13.
14.     printf("Scores\n");
15.
16.     input_status = scanf("%d", &score);
17.     while (input_status != EOF) {
18.         printf("%5d\n", score);
19.         sum += score;
20.         input_status = scanf("%d", &score);
21.     }
22.
23.     printf("\nSum of exam scores is %d\n", sum);
24.
25.     return (0);
26. }
```

**FIGURE 5.13** Nested Counting Loop Program

```
1.  /*
2.   * Illustrates a pair of nested counting loops
3.   */
4.
5.  #include <stdio.h>
6.
7.  int
8.  main(void)
9.  {
10.     int i, j;    /* loop control variables */
11.
12.     printf("          i      j\n");          /* prints column labels          */
13.
14.     for (i = 1;  i < 4;  ++i) {              /* heading of outer for loop          */
15.         printf("Outer %6d\n", i);
16.         for (j = 0;  j < i;  ++j) {          /* heading of inner loop              */
17.             printf("Inner %9d\n", j);
18.         } /* end of inner loop */
19.     } /* end of outer loop */
20.
21.     return (0);
22. }
```

	i	j
Outer	1	
Inner		0
Outer	2	
Inner		0
Inner		1
Outer	3	
Inner		0
Inner		1
Inner		2

# do-while Statement

- For conditions where we know that a loop must execute at least one time
  1. Get a *data value*
  2. If *data value* isn't in the acceptable range, go back to step 1.

# do-while Syntax

do

statement;

while (loop repetition condition);

```
/* Find first even number input */
```

```
do
```

```
    status = scanf("%d", &num);
```

```
while (status > 0 && (num % 2) != 0);
```

# Flag-Controlled Loops for Input Validation

- Sometimes a loop repetition condition becomes so complex that placing the full expression in its usual spot is awkward
- Simplify the condition by using a **flag**
- **flag**
  - a type int variable used to represent whether or not a certain event has occurred
  - 1 (true) and 0 (false)

**FIGURE 5.14** Validating Input Using do-while Statement

```
1.  /*
2.   * Returns the first integer between n_min and n_max entered as data.
3.   * Pre : n_min <= n_max
4.   * Post: Result is in the range n_min through n_max.
5.   */
6.  int
7.  get_int (int n_min, int n_max)
8.  {
9.      int    in_val,           /* input - number entered by user   */
10.         status;              /* status value returned by scanf  */
11.      char   skip_ch;          /* character to skip                */
12.      int    error;             /* error flag for bad input         */
13.      /* Get data from user until in_val is in the range. */
14.      do {
15.          /* No errors detected yet. */
16.          error = 0;
17.          /* Get a number from the user. */
18.          printf("Enter an integer in the range from %d ", n_min);
19.          printf("to %d inclusive> ", n_max);
20.          status = scanf("%d", &in_val);
21.
22.          /* Validate the number. */
23.          if (status != 1) { /* in_val didn't get a number */
24.              error = 1;
25.              scanf("%c", &skip_ch);
26.              printf("Invalid character >>%c>>. ", skip_ch);
27.              printf("Skipping rest of line.\n");
28.          } else if (in_val < n_min || in_val > n_max) {
29.              error = 1;
30.              printf("Number %d is not in range.\n", in_val);
31.          }
32.
33.          /* Skip rest of data line. */
34.          do
35.              scanf("%c", &skip_ch);
36.          while (skip_ch != '\n');
37.      } while (error);
38.
39.      return (in_val);
40. }
```

# Off-by-One Loop Errors

- A fairly common logic error in programs with loops is a loop that executes on more time or one less time than required.
- If a sentinel-controlled loop performs an extra repetition, it may erroneously process the sentinel value along with the regular data.
- loop boundaries
  - initial and final values of the loop control variable

# Wrap Up

- Use a loop to repeat steps in a program
- Frequently occurring loops
  - counter-controlled loop
  - sentinel-controlled loop
- Other useful loops
  - endfile-controlled loop
  - input validation loop
  - general conditional loop
