A special compound prop.: 79 = 77p The contrapositive of p=79. P 9 P=79 79 7P 79=>7P P=79(=)79=>7P Note mat the converse of p=79 is not/ P=7979=7P Recall proofs by contradiction. Claim 4.18 (part of it) If n2 is even, men n is even. Why aid we do a proof by contradiction? let n² be even. WTS n is even.

n2=2C for CEI del. of even n=  $\sqrt{2c}$  ) we don't have any n=2c facts about these n is even

Claim If n2 is even, from n is even? For contradiction, suppose 7(p=79)

7(p=79) = p179

3) divert proof that 79=>7p

established that 7p1p

noted pad 7p1p is a contradiction

7(p=79) is false, so p=79 is true Proof For Contradiction, suppose me claims is false. That is, suppose that he is even but n is odd. > 19 n=24+1 for EEZ n2= (2++1)2 divert 3 rg=7 p n2= 4 k2 + 4 k + 1 n2=2(2×2+2×)+1 N2 = 2C+1 for CEZ J = 1919 (4) n' is odd 7p This contradicts that n' is even. So our initial assumption that n is odd is false. So the initial claim is true. Note that 3 was a divert proof of the contrapositive. For this claim, we can give a shorter proof.

9,9,4. (p19)=7r is daim. 15 7r =7 7 (prg) pre contrapositive? let me reurse p19 as Z. フィニファモ 1 r = 77 (p/g)

Claim If n² is even, then n is even. Proof we will prove the contrapositive. That is, if his odd, men n2 is odd. n=2k+1 Gr KEZ del. odd n2= (2K+1)2 n2= 4×2+ 4×+1 n2=2(2K2+2K)+1  $c = 2k^2 + 2k$ prod., sum of ints is int n=2c+1 for cEZ n2 is odd Note you can only use contapositive proofs on if-then statements. Sometimes a divert proof is easier/simpler. Proposition suppose XEZ. If 7x+9 is every men x is odd. Proof (direct) Suppose 7x49 is even. 7x+9=2c for C&Z del. of even

X = 2C - 6X - 9algelora X = 2C - GX - 2.5 + 1reuniting -9 x = 2((-3x - 5) + (factoring sums, prods of ints are int X=2×+1 for K=2 ael. of odd x odd 79 -7 70 Proof (by contrapositive) we prove the Contrapositive. That is, if x is even, then 7x + 9 is odd.
Suppose x is even. w TS that 7x + 9 is odd. prod. of any even int, int is even 7x is even sum of eveni odd 7x+9 is odd (4.17) Claim suppose y \$0 if \$\forag{7} is irrational}.

Then x is irrational or \$\forag{9}\$ is irrational}. p=>(q~r) Contrapositive = (qvr) => -p = (7917+)=7-p

If x, y rational, then x/y is restoral. Done, by the 1 problem 1.
