So far: uneter something occus Now: how many? flip a win to get 100 heads? In a randomly sorted array, for now many slots is A[i] < A[i+1]? det random variable A random variable X assigns a numerical value to every outcome in the sample spaces. Note: random variable is a

X: S -> P bad name frmis! ex suppose we fip a fair win & times. S = 2 H, T 3 = 2 HHH, HHT, ... } Pr[x] = 1 AxES let X = # heads Y = # of consecutive T (from start)

ex Ut 5 be the set of all English words. let L= # letters L (computer) = 8 Det The expectation of a random variable X, denoted E[X], is the average value of X. E[X] = EX(x) · Pr[x]. E[X] = E y · Pr[X=y] y:3xes: X(x)=y ex Counting heads in 3 coin flips I[X] = EX(x) Pr[X]. Elways 1/8 = X (HHH) Pr[HHH] + X (HHT) Pr[HHT] = 2 (X(HHH) + X(HHT) + X(HTH) + X(HTT) + X(THH) + X(THT) + X(TTH)+X(TTT)) $=\frac{1}{6}(3+2+2+1+2+1+1+0)$ $=\frac{1}{2}(12)=\frac{12}{6}=1.5$

let X,, Xz,..., X10 be random easier way: variables Xi= { O sherwise So total # heads is X,+ X2+ ... + X16 $E[X] = E[X_1 + X_2 + \cdots + X_{10}] = \underbrace{E[X_1]}_{(=1)} = \underbrace{E[X_1]}_{(=1$ ex suppose we hash 1000 elements into a 1000-slot table using a random hash function, resolving collisions by chaining. [h(1) = 55 (4) ... (1,3) ... 2 ... [2] 1 2 55 967 999 1000 h(2)=967 h(3) = 55h(4)=1How many empty slots do we expect? let 5 be all outromes: all ways of hashing 1000 elements into the table. let X be the random variable wonting # of empty scots. Qunich x has X(x) - 0? $\chi(x) = 999^{?}$ 15 here an xES s.t. X(x) = 1000?

Pr[X(x)=5) is... hard to figure out. Pr[slot i is empty] = - Pr[none of the 1000 elements hashes to i] = fr (every element j & 21,2,..., 1000) hashes to slot other tran i] $= \left(\frac{999}{1600}\right)^{1000} \approx 0.3678$ let Xi = { 0 if slot i empty $E\left[\sum_{i=0}^{1000} \chi_{i} \right] = E\left[\sum_{i=0}^{1000} \chi_{i} \right] = (000 \cdot 0.3678 = 367.8)$
